# UTI Microfluidic Cartridge Diagnostic Report

Scan ID: scan_mua50b2qipgx | Date: 9/20/2026, 11:45:54 PM | Batch: GENEX-B26-09

**Patient Name: Rajesh Sharma (48y / Male)** **MRN: MRN-AIIMS-90481**

Facility: AIIMS New Delhi - Clinical Microbiology Reference Lab | Clinician: Dr. Rajesh Malhotra, MD (AIIMS Infectious Diseases)

## DIAGNOSTIC STATUS: ASYMPTOMATIC BACTERIURIA — K. PNEUMONIAE

Pathogen detected (K. pneumoniae) in the absence of significant pyuria (<10 WBC/µL (Normal physiological range)). This pattern is consistent with asymptomatic bacteriuria or epithelial colonization. Routine antimicrobial therapy is generally withheld per stewardship guidelines unless indicated by high-risk conditions (e.g. pregnancy). [HIGH-RISK RECURRENCE PATTERN: Recurrent UTI pattern detected: 12 positive scans recorded in the past 6 months. Repeat infection detected with Klebsiella pneumoniae (5 visits in past 6 months). Resistance change detected: Ciprofloxacin evolved from Sensitive (9/19/2026) to Resistant. Worth discussing antimicrobial prophylaxis or urological evaluation with a clinician.]

## 1. Pyuria / Pus-Cell Assay (Layer 1)

Infection Severity: Negative WBC Estimate: <10 WBC/µL (Normal physiological range) Signal OD: 0.000

## 2. 4-Plex Pathogen Aptamer Panel (Layer 2)
